

System Requirements For the BKB-FXTrading Application

1.1 Hardware

- 512 MB RAM minimum and at least 1 GB highly recommended. More may be required depending on number of applications running. BKB-FXTrader performance will be directly affected by the local operating system, and thus performance will be degraded if the operating system is highly overloaded.

1.2 Software

- Sun Java Plug-in version 1.6.0_10 or higher. The plug-in is part of the Java Runtime Environment (JRE): BKB-FXTrader recommends the latest patch version of java 1.6.0, which can be downloaded from: <http://www.java.com>

Note that in cases where another version of Java is required by other, existing applications, multiple versions of Java can be installed in parallel. Please contact Basler Kantonbank for more details.

Please select the JRE version of Java for downloading. The SDK version available on the above page is intended only for developers.

The currently installed version of Java can be confirmed using the link below:

<http://www.java.com/en/download/installed.jsp>

For further help installing and running Java, try: <http://java.com/en/download/help/>

- Windows NT, Windows 2000, Windows XP or Windows Vista recommended (other operating systems possible if above Java Plugin and browser versions are available)
- If ActiveX is not enabled or a non-Microsoft browser is to be used, then an alternative URL for BKB-FXTrader is required. Please contact us.
- At least 50MB available on the local harddrive for the Java Plugin to cache the client applet. Typically this space must be available in the user's home directory

For Windows XP:

c:\Documents and Settings\,

for Windows Vista: c:\users\.

However, the directory used to cache the client applet can be specified as an arbitrary locatoion in the Java Control Panel.
